Price: 3500 USD (Single User License)

Description

A nosocomial, or hospital-acquired, infection is a new infection that is usually defined as an infection that is identified at least forty-eight to seventy-two hours following admission. This type of infection is also known as a hospital-acquired infection (or more generically healthcare-associated infections).

Marketing planners in the pharmaceutical or diagnostic industries should have an understanding of the market impact of nosocomial infections, as it will be an important consideration in these markets into the near future.

This report. Hospital Acquired Infections (Nosocomial) : Diagnostic and Pharmaceutical Market Considerations : MRSA, HAP, Cdiff and Other market impact of treating the following infections are discussed in detail:

- Acinetobacter baumannii
- Clostridium difficile
- Gastroenteritis
- Hospital-acquired pneumonia (HAP) and ventilator associated pneumonia
- Methicillin resistant staphylococcus aureus MRSA
- Pseudomonas aeruginosa
- Staphylococcus aureus
- Stenotrophomonas maltophilia
- Tuberculosis
- Urinary tract infection
- Vancomycin-resistant enterococcus

This report covers nosocomial infection diagnosis and therapeutics in a broad sense. It does not go into the detail of the dynamics of individual products in the marketplace. It discusses, however, the status of the field of nosocomial infection diagnostics and therapeutics, as a setting-specific field of application.

The Most Recent and Relevant Epidemiological Statistics on HAIs

There is no 'nosocomial infection' market per se, it is reflected in sales and revenues of all infectious disease testing and therapeutics. Therefore Kalorama's market analysis in this report considers primarily the epidemiological considerations and the sizes patient groups both in the United States and globally, where available. We have accumulated the most recent data available, understanding that virtually no organization does extensive studies on these applications on a regular basis. Many studies are highly localized and may only apply to a community, state or country (more often countries that are not a part of the major markets for nosocomial diagnostic and therapeutic products).

In many instances, we have had to draw from broader epidemiologic data, that is, on data that reach outside of the hospital environment in order to try and construct a picture of the nosocomial testing needs.

Estimates of Market Impact

As mentioned above, the primary focus of this report is on the bacterial form of nosocomial infections, and those with significant impact on the hospital setting and markets. In looking at these infections, we consider the diagnostic and therapeutics technologies that are currently available and attempt to project trends in these product areas.

Company Profiles and Competitive Assessment

This report examines the key players in HAI infection diagnostics and pharmaceutical treatment, their revenues, and activity in the market. To some extent, we are limited by the activity of the industries associated with the diagnosis and treatment of these infections. For the most part, these activities are limited and the advanced technologies seen in other areas of medical application are not necessarily present in terms of microbiology. This presages opportunities for new competitors

The analysis presented in this report is based on data from a combination of company, government, industry, institutional and private sources. It includes information from extensive literature reviews and discussions with experts in the field, including microbiologists, pathologists, hospital authorities, research scientists, business development managers and marketing managers.
